No. is the number of results predicted by chance to have score greater than or equal to the score of the result being and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                    Score

The present comment in the sased upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product cof the alternative transcript is a truncated HER-2 protein designated cof the alternative transcript is a truncated HER-2 protein designated cof the alternative transcript is a truncated HER-2 protein designated cof page 185 met. The present sequence and intracellular domains of the HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify concleic acids encoding these are useful to treat, diagnose and identify coldidations. The present sequence is possessed by polymorphic form of human HER-2 intron 8.

CC (ANEROMAN) and the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 partial protein containing ECDIIIa variant sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different of the binding site of humanised antibody, Herceptin, at an affinity of at least 10'8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product

                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for treating a solid tumour characterised by endothelial growth factor receptor (EGFR) expression. The method involves administering an agent that binds to an extracellular domain (ECD) of EGFR. The invention also relates to a naturally occurring inhibitor of HER-2 receptor tyrosine kinase called herstatin. The coexpression of herstatin with pl85HER2 causes a striking reduction in cell growth that corresponds with suppression of pl85 autophosphorylation. The method or a pharmaceutical composition is useful for treating a solid tumour (selected from squamous cell carcinoma, lung carcinoma, colon carcinoma and glial cell tumour) characterised by EGFR expression. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating solid tumor characterized by expression of endothelial growth factor receptor, involves administering recombinant herstatin that binds to extracellular domain of the endothelial growth factor receptor

                                                                                                                                                                                                                                                                                                                                                              В
                                                                                                                                                                                                                                                                                                                                                                                       Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CC p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the CC uncleic acids encoding these are useful to treat, diagnose and identify CC solid tumours. The present sequence is p68HER-2 ECDIIIa variant CC encoded by polymorphic form of human HER-2 intron 8.

CC derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 CC (AAF09194).
                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECDIIIa variant encoded by polymorphic form of human HER-2 intron 8.

Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10'8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Clinton G, Henner WD,

                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                        δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CC p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the CC uncleic acids encoding these are useful to treat, diagnose and identify CC solid tumours. The present sequence is p68HER-2 EDIIIa variant CC encoded by polymorphic form of human HER-2 intron 8.

CC derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 CC (ABERGIA)

The extracellular domain of p185-HER-2 is proteolytically shed from breast carcinoma cells in culture and is found in serum of some cancer patients and may be a serum marker of metastatic breast cancer. An alternative HER-2 mRNA of 4.8 kb with a 274 bp insert (intron 8) has been dentified. The retained intron is in-frame and encodes a 79 amino acid extension designated ECDIIIa (the present sequence), which is inserted at residue 340 of p185-HER-2. The alternative mRNA predicts a truncated HER-2 protein (approximately 68 kba) that lacks the transmembrane and intracellular domains (see AAY97240), p68HER-2 specifically binds to p185-HER-2 without activating HER-2. It could therefore block dimerization of p185-HER-2. The p68HER-2 polypeptide binds to a site on the ECD of HER-2 that is different from the site of binding for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Herceptin (RTM) (a marketed humanized monoclonal antibody that is used for the treatment of cancer and binds to the ECD of HER-2). The methods, compositions, polypeptides and antibodies are used to treat solid tumours such as breast cancer, small cell lung carcinoma, ovarian cancer and/or colon cancer, especially where over-expression of HER-2 is

The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIa. The ECDIIIA-contains ECD I, II of the p185HER-2 and the novel ECDIIIA the ECDIIIA-contains polypeptides bind tiphtly to, and thus anragonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is ECDIIIa domain of human p68HER-2 protein encoded by intron 8 of HER-2 gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for treating a solid tumour characterised by endothelial growth factor receptor (EGFR) expression. The method involves administering an agent that binds to an extracellular domain (ECD) of EGFR. The invention also relates to a naturally occurring inhibitor of HER-2 receptor tyrosine kinase called herstatin. The coexpression of herstatin with pl85HER2 causes a striking reduction in cell growth that corresponds with suppression of pl85 autophosphorylation. The method or a pharmaceutical composition is useful for treating a solid tumour (selected from squamous cell carcinoma, lung carcinoma, colon carcinoma and glial cell tumour) characterised by EGFR expression. The present sequence is a protein encoded by human HER2 intron 8.
    Clinton G,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CC p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the novel ECDIII a coids encoding these are useful to treat, diagnose and identify C solid tumours. The present sequence is p68HER-2 ECDIIIa variant CC encoded by polymorphic form of human HER-2 intron 8.

CC Note: The present sequence is not shown in the specification but is CC (AAEO1914)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            οy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        particularly a polypeptide that binds to the extracellular domain (ECD) Cof HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10-8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of The HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECDIII variant cencoded by polymorphic form of human HER-2 intron 8.

Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Дb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  particularly a polypeptide that binds to the extracellular domain (ECD) cof HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p69HER-2 which lacks the transmembrane and intracellular domains of 20°C p185HER-2 but contains ECD I. II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides bind tightly to, and the novel ECDIIIa concleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECD, and the concleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECDIIIa variant are necessary to the present sequence is not shown in the specification but is concleic acids encoded by polymorphic form of human HER-2 intron 8 encoded ECDIIIa sequence given in figure 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Db
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CC p189HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA contains pCD I, II of the p185HER-2 and the novel ECDIIIa contains pclypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the CC nucleic acids encoding these are useful to treat, diagnose and identify CC solid tumours. The present sequence is p68HER-2 intron 8.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC pf8HER-2 which lacks the transmembrane and intracellular domains of CC pf8HER-2 but contains ECD I, II of the pf85HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the CC uncleic acids encoding these are useful to treat, diagnose and identify CC solid tumours. The present sequence is p68HER-2 ECDIIIa variant CC encoded by polymorphic form of human HER-2 intron 8.

CC Note: The present sequence is not shown in the specification but is CC (Arengalaa)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                      The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CC p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the CC nucleic acids encoding these are useful to treat, diagnose and identify CC solid tumours. The present sequence is p68HER-2 ECDIIIa variant CC encoded by polymorphic form of human HER-2 intron 8. CC derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 carived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8.

                                                                                           FUNCTION: Functions as a receptor for membrane-bound ligands Jaggedl, Jaggedl and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.
                                               Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). Acts instructively to control the cell fate determination of COS multipotent progenitor cells, resulting in astroglial induction and neuron/oligodendrocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SPDYSPSAGYSPTLPGY 1808

PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentil dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ween the Swiss Institute of Bioinformatics Institute.

Following proteolytical processing NICD is translocated to the nucleus. TISSUE SPECIFICITY: Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. It is more highly localized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SWISS-PROT entry is copyright. BEHAVES AS A MEGATIVE ELEMENT IN CIRCADIAN TRANSCRIPTION
FACTOR. BEHAVES AS A MEGATIVE ELEMENT IN CIRCADIAN TRANSCRIPTIONAL
LOOP. DOES NOT APPEAR TO BIND DNA, SUGGESTING INDIRECT
TRANSCRIPTIONAL INHIBITION. EXPRESSION OSCILLATES WITH A 24 HR
RHYTHM IN THE SUPRACHIASMATIC NUCLEUS (SCN) AND THE WHOLE EYES.
OSCILLATIONS ARE MAINTAINED UNDER CONSTANT DARKNESS AND ARE
RESPONSIVE TO CHANGES OF THE LIGHT/DARK CYCLES. THERE IS A 4 HOUR
TIME DELAY BETWEEN PERI AND PER2 OSCILLATIONS. THE EXPRESSION
RHYTHMS APPEAR TO ORIGINATE FROM RETINA (BY SIMILARITY).
-!- SUBCELULUAR LOCATION: NUCLEAR (POTENTIAL).
-!- TISSUE SPECIFICITY: WIDELY EXPRESSED. FOUND IN HEART, BRAIN,
PLACENTA, LUNG, LIVER, SKELETAL MUSCLE, KIDNEY AND PANCREAS.
-!- INDUCTION: BY LIGHT (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF
TRANSCRIPTION FACTORS.
                                                                                                                                                                                                                                                                                                        This

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
